Django + Nginx Setup :

1. **System update & package install**
   Updates Ubuntu packages and installs Python tools (pip, venv) and **Nginx** web server for hosting Django.
2. **Project directory & virtual environment**
   Creates a project folder and Python virtual environment to isolate Django dependencies from the system.
3. **Django installation & project creation**
   Installs **Django** and **Gunicorn**, then creates a Django project (mysite) which contains settings, URLs, and WSGI config.
4. **App creation & database setup**
   Creates a Django app (core), runs migrations to prepare the database, creates admin user, edits settings, and starts the server on 0.0.0.0:8000 to allow external access

USED COMMANDS TO DEPLOY:

1. **sudo apt update && sudo apt upgrade -y**
   Updates package list and upgrades all installed packages to latest versions.
2. **sudo apt install python3-pip python3-venv nginx -y**
   Installs Python package manager, virtual environment support, and Nginx web server.
3. **python3 --version**
   Checks installed Python version.
4. **mkdir myproject**
   Creates a new directory for the Django project.
5. **cd myproject**
   Moves into the project directory.
6. **python3 -m venv venv**
   Creates a Python virtual environment named venv.
7. **source venv/bin/activate**
   Activates the virtual environment.
8. **pip install django gunicorn**
   Installs Django framework and Gunicorn application server.
9. **django-admin startproject mysite**
   Creates a new Django project named mysite.
10. **cd mysite**
    Enters the Django project folder.
11. **python manage.py startapp core**
    Creates a Django application named core.

12. **nano mysite/settings.py**
    Opens Django settings file for configuration changes.
13. **python manage.py migrate**
    Applies database migrations.
14. **python manage.py createsuperuser**
    Creates an admin user for Django admin panel.
15. **python manage.py runserver 0.0.0.0:8000**
    Runs Django development server accessible from any IP on port 8000.
