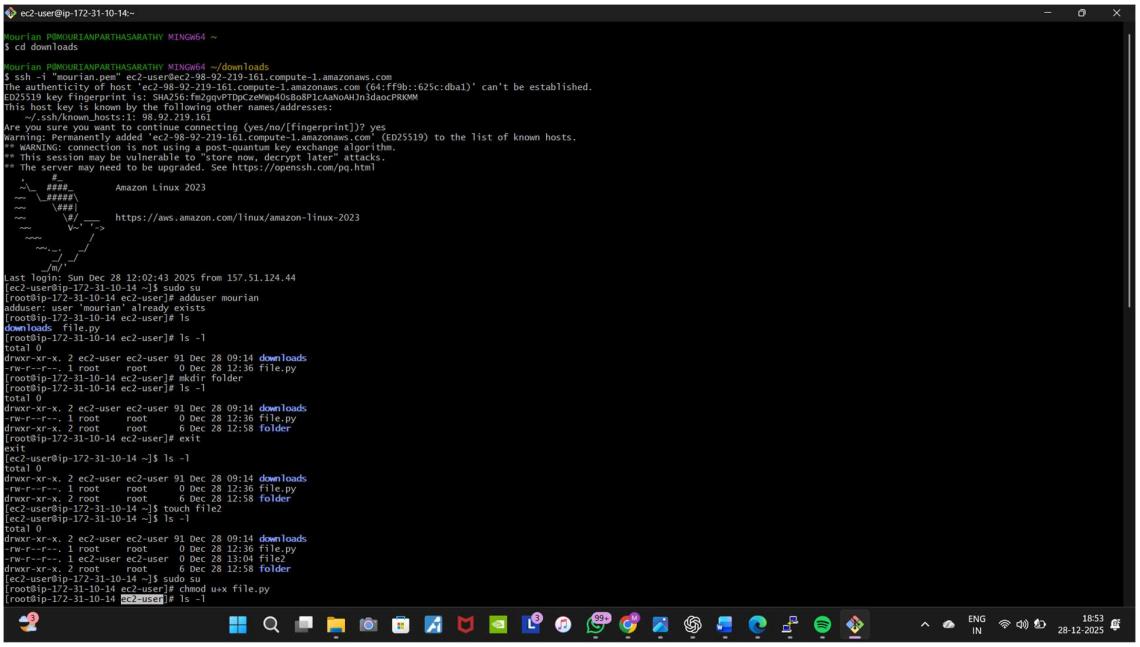
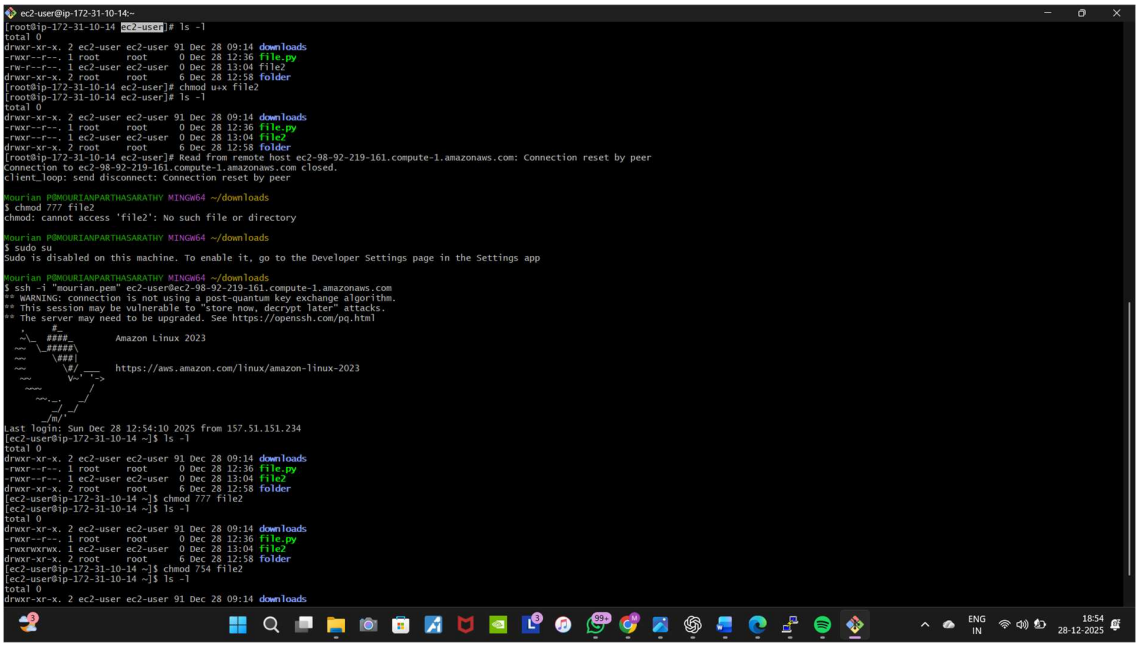
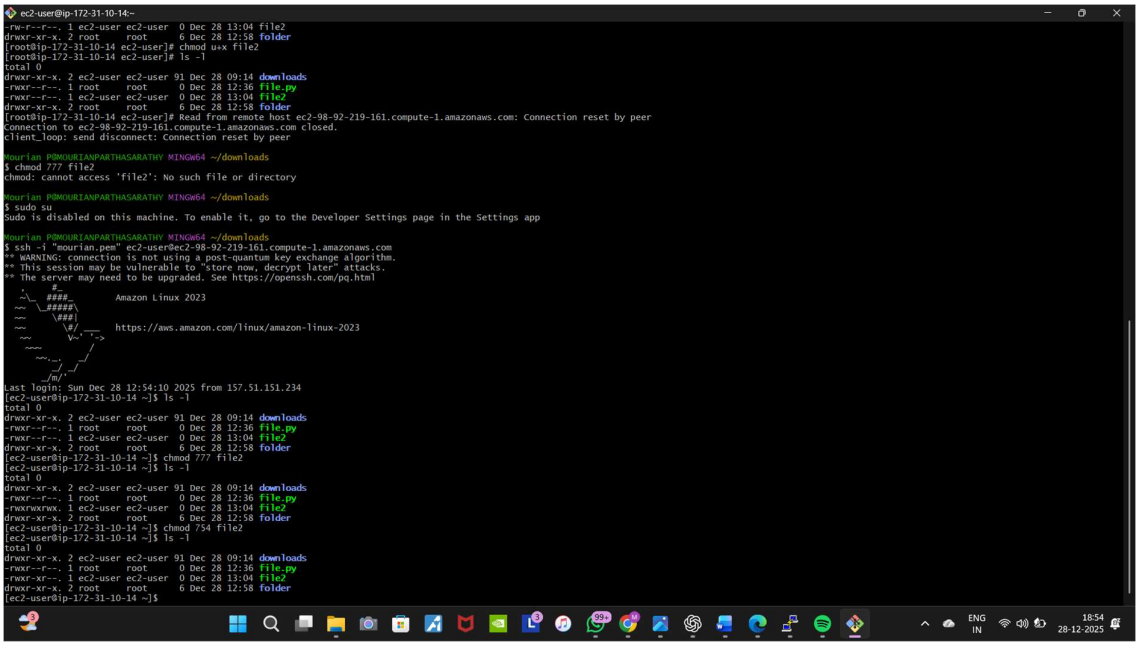
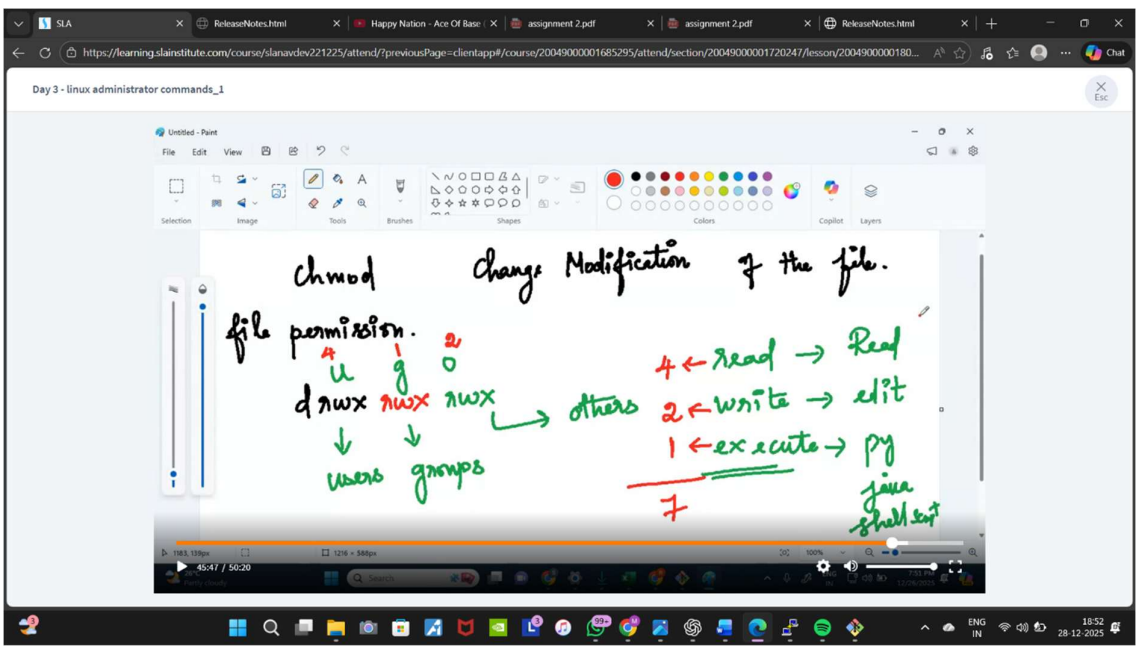
ASSIGNMENT 3

LINUX ADMINISTRATOR COMMANDS









These last three snaps are the numerical form of file permission commands. Command is chmod 777 4 = Read , 2 = Write and 1 = Execute You have to add the numbers to give permission to user, group and others. It means 7 = all Permission , 6 = Read and Write , 5 = Read and Execute, 4 = Read , 3 = Write and Execute , 2 = Write , 1 = Execute , 0 = No Permission.

- **Why permission is needed?**
  To protect files from unauthorized access and prevent misuse or accidental changes.for to give only user can only access the file

- If you have many users means you can see selected users by this command <cat /etc/passwd | grep The command name> .<cat /etc/passwd >will shows the users in the root directory.

- For changing password for the <users passwd>.

If you want to create group use groupadd<groupname>,To see the created group

<cat/etc/group | grep>.

File Permission Commands

For giving permission for file you have to write these command< chmod ugo+rwx>. u stands Users , g stands Groups , o stands Others , r stands Read , w stands Write and x stands for Execute.
